

Rock Salt

Anchor ice melting products are the safer way to go when dealing with dangerous conditions caused by ice and snow in walking, parking and loading areas on your premises.

Recommendations

Anchor Rock Salt is extremely effective if applied before snowfall or freezing begins. Following a storm, spread rock salt over affected area. Allow a few minutes for the salt crystals to melt the accumulated snow and ice.

Removal: Remove slush formed with a shovel or scraper. Do not pile on lawn or shrubbery.

Notice: Concrete surfaces which have been poorly constructed, are not air entrained or of sufficient age, may become damaged through prolonged application. To minimize this effect, remove melted ice and snow soon after application. This product has no adverse effect of asphalt. Not recommended for concrete less than one year old or poor grade concrete.

Physical Properties

Appearance: White/Off-White

Odour: None

ANCHOR ROCK SALT

- An economical de-icing choice for large areas
- Extremely effective if applied before snowfall or freezing begins
- 20kg bag. 56 bags per pallet
